Week 1 — Case Introduction & Planning

ACC 4510 • Reliability Tire Company • Understanding the engagement

Project Introduction

This week you will get your first look at the case and the documents that will drive your analysis. As a class, you will use an AI coding agent to begin working through the pricing table. Then, as a group, you will step back and build a plan for how you will complete the full assignment using the SCOPE framework. The deliverable this week is not a completed analysis — it is a well-structured plan for how you will get there.

Key concepts to keep in mind

- Forensic accountants define the **scope** of an engagement before any analysis begins — rushing into the data without a plan produces unreliable results
- AI coding agents are tools, not decision-makers. **You** set the objective, provide context, constrain the output, demand proof, and evaluate the result
- You only have **partial information** this week. Your plan should reflect that — acknowledge what you know, what you still need, and how you will handle each document
- A group that plans carefully in Week 1 will move faster and catch more errors in Weeks 2 and 3

Documents available this week

Pricing Table
(https://uvu.instructure.co wrap=1)
(https://uvu.instructure.co download_frd=1)

The StopSure tire pricing list — the basis for calculating claim amounts across tire qualities, sizes, and diameters.

Reliability Sales Ledger
(https://uvu.instructure.co wrap=1)
(https://uvu.instructure.co download_frd=1)

Reliability's internal record of all sales in 2012–2013. You have the first page only this week.

Example Invoice
(https://uvu.instructure.co wrap=1)
(https://uvu.instructure.co download_frd=1)

A sample retailer invoice showing the structure of the proof-of-sale documents you will work with in full later.

Table of Claims
(https://uvu.instructure.c wrap=1)
(https://uvu.instructure.c download_frd=1)

The summary of claims filed by six retailers. You have the first page only this week — enough to understand its structure and what each column represents.

The SCOPE Framework

S Set the Objective
- State the exact task

C Context and Data
- Give the tool the right files

O Output and Constraints

P Proof and Checks
- Require evidence, not

E Evaluate and Extend

- Define what success looks like
- Tie the task to a financial question or decision

and background
- Define important fields, terms, and report structure
- Tell it what matters most and what is only supporting detail

- Specify the exact format and deliverable
- Set guardrails — what the agent must not do
- Distinguish facts from assumptions explicitly

just answers
- Ask for tie-outs and reconciliations
- Flag anything that does not tie out cleanly
- Show where the number came from

- Review the result critically
- Refine the prompt based on what failed
- Turn a one-time success into a repeatable workflow

IN CLASS **What we'll do together**

- Walk through the SCOPE framework and how it applies to forensic accounting engagements and AI-assisted workflows
- As a class, begin filling out the pricing table using the instructions on the pricing document. Then, use an AI coding agent to finish the task. Provide the right context and double check whether the output can be trusted using the Proof and Checks step of SCOPE.
- Discuss what each source document contains, what role it plays in the analysis, and what a complete workflow will need to look like

THIS WEEK **As a group, build your plan**

Create groups of 2-3 class members and join the group in the People tab on Canvas. DO NOT JOIN A GROUP WITHOUT FIRST DISCUSSING WITH GROUP MEMBERS! All assignments will be turned in through the group submissions system.

Using the documents provided and what you learned in class, your group will draft a SCOPE Framework write-up that lays out your plan for completing the full assignment. You are not being asked to complete the analysis — you are being asked to plan it.

Apply each element of the SCOPE framework to this engagement: What is the objective? What context and data will the agent need? What output will you require and what constraints will you set? How will you verify results? How will you evaluate and refine the workflow as you go? Your write-up should reflect the partial information you have now and show that your group understands both the task ahead and the tools you will use to tackle it.

The six fraud checks your group will need to run

You won't run these this week — but understanding them now is essential to building a good plan.

1. **Date validity** — StopSure tires were only sold from January 30 to December 3, 2013. Flag any purchase date outside this window as ineligible.
2. **Invoice cross-reference** — Match every claim against the source invoices. Flag any claim with no matching invoice, or where the invoice details (customer name, tire style, quantity, width, diameter) do not match what was claimed.
3. **Sales ledger cross-reference** — Confirm the retailer had received inventory from Reliability before the claimed sale date. A retailer cannot sell a tire they did not yet own.
4. **Pricing accuracy** — Recalculate the correct retailer reimbursement and customer inconvenience payment for every claim using your price model. Flag any claim where the retailer's calculation is incorrect.
5. **Duplicate claims** — Check for the same invoice number, customer name, or date/amount combination appearing more than once across any retailer's submission.
6. **Non-StopSure tires** — Only tires from the StopSure product line are eligible for reimbursement. Flag any claim for a different product.

💡 Tips for working with AI coding agents

- **Tell the agent the documents may or may not need to be OCR'd.** OCR stands for Optical Character Regognition and is the process of converting a non-machine readable document into a document with characters. The documents may need help here, but they may not. Use your tool to guide you through this process if you need to.
- **Separate your work into multiple Python scripts.** Rather than writing one large script that does everything at once, break the process into stages — one script to parse a document, another to compute values, another to produce output. This makes it much easier to check your work at each step and catch errors before they compound.

Week 1 Deliverable — Group Submission

SCOPE Framework Planning Write-Up — As a group, submit a write-up that applies the SCOPE framework to your planned approach for this engagement. Your submission should explain your objective, the context and data the agent will need, what outputs and constraints you will set, how you will verify results, and how you plan to refine the process as you go.

- Use this **Scope Framework Template (https://uvu.instructure.com/courses/644179/files/132744408?wrap=1)** **(https://uvu.instructure.com/courses/644179/files/132744408/download?download_frd=1)** document to structure your assignment.

File Name	Size	
SCOPE Framework.docx	17.9 KB	Download **(https://uvu.instructure.com/files/132790624/download?download_frd=1&verifier=CM8EW1XviyqqvHxa0s8oP5BgPGdG3PEoGxCxd2Vu)**

SCOPE Framework Worksheet

Aubrey Rogers, Blake Cherrington, & Caitlin Watkins

About This Framework

The SCOPE Framework is a structured approach to working with agentic AI tools in accounting and finance. Rather than replacing professional judgment, agentic tools raise the value of judgment. SCOPE helps you define the work, shape the environment, control the output, demand proof, and improve the process — turning one-time prompts into repeatable professional workflows.

Instructions: For each letter of the SCOPE framework, describe how you applied that step in your work.

S — Set the Objective

BEGIN WITH THE END IN MIND

State the exact task you are assigning the agent. Define what success looks like and tie the task to a specific financial question or decision. If the objective is vague, the output will be vague.

The exact task is to reconstruct the proper claim reimbursement amounts for each customer using the pricing rules and information given by Reliability Tire Company. The next step would be to compare the actual claims submitted against the table of claims and the invoices given. The success in this project will be to determine the financial loss/income due to claims while identifying which retailers are overcharging in the reimbursement program.

C — Context and Data

WHAT THE AGENT NEEDS TO WORK FROM

Describe the files, background, and definitions you will provide to the agent. Identify which documents are most important and define any key fields, terms, or report structure the agent needs to understand.

The data we have been given is a variety of documents. The prices pdf includes the pricing rules and a pricing table we will need to complete. The Reliability Tire Sales Ledger is what is actually sold to customers. Whereas the table of claims is the list of claims customers have filed for reimbursements. The invoices is the supporting documentation for specific claims from a specific retailer. In regards to the information given, the documents include tires other than the StopSure ones and retailers other than the ones we need to audit. We will need to clean up the documents, so when we use antigravity or other tools it won't hallucinate or use information that is not needed.

O — Output and Constraints

DEFINE WHAT TO PRODUCE — AND WHAT NOT TO DO

Specify the exact format and deliverable you expect. Then set guardrails — what the agent must not do.
